PRINTFAIR

ITCC 41 MILESTONE 3 - PROGRESS REPORT

Group Members: Gio Duldoco, Godofredo Natividad III, Yassin Unte

Instructor: Francis King Uyguangco

1. Project Overview

PrintFair is a mobile application designed to organize the printing request process at the Xavier University Library. It provides separate Student and Admin interfaces and a connected kiosk webpage for document retrieval. Supabase supports authentication, database operations, document storage, and real-time updates.

2. Completed Features

- Document and Printing Request Management - Students can upload PDF documents, review document information and page counts, submit printing requests, and view request status.
- Print Access and Station Management - Students can view printing station information. Administrators can manage station availability, and the separate kiosk webpage accepts retrieval codes to provide access to prepared documents.
- Printing Allowance and Transaction Management - The system checks the daily page allowance, updates the remaining allowance after requests, and displays transaction records to administrators and printing history to students.

3. Application and Technologies

The application is built with Apache Cordova, HTML, CSS, and JavaScript. Supabase is used for backend services, including authentication, database storage, document storage, and real-time updates. Git and GitHub are used for source-code management, while Android Studio and the Android SDK support Android development.

The group generated an Android debug APK and installed it on an android phone device for initial physical-device testing.

4. Development Status

Status	Details

Completed	Core Student, Admin, and Kiosk workflows; PDF upload and preview; printing requests; allowance updates; request cancellation; station availability management; transaction records; retrieval-code workflow; Supabase integration; real-time updates; Android APK build and installation.
Remaining	Improve the application's responsive design, particularly the bottom navigation bar. Some navigation icons (Home, Transactions, and other sections) appear to overflow or extend outside the navigation bar. Adjust the layout, spacing, and alignment to ensure the interface displays properly across different screen sizes. Conduct final testing and update the repository documentation.

5. Problems Encountered and Solutions

Problem encountered	Solution implemented
Integrating the Student, Admin, and Kiosk workflows with the shared Supabase backend required coordinating their data and operations	Integrated the application components with Supabase so that requests, transactions, station information, and retrieval operations use the shared backend
Ensuring that printing allowance changes were reflected correctly after requests and cancellations	Implemented allowance validation and updates through the backend and verified the changes during testing

Connecting the kiosk retrieval process with student printing requests required validating retrieval codes and providing access to the correct uploaded document	Implemented the retrieval-code validation and document-access workflow through the Supabase backend.
Preparing the web-based application for Android deployment required configuring the Cordova Android build environment	Configured the Android SDK and Gradle, added the Cordova Android platform, and successfully generated the Android APK

6. Testing Summary

The group's testing evidence records successful checks of PDF upload and preview, page counting, request submission, allowance deduction, request cancellation, administrator visibility of requests and transactions, station availability management, daily page-limit enforcement, kiosk retrieval-code validation, PDF access, and the student's retrieved-document history. The detailed screenshots and test outcomes are provided in the Demonstration of Implemented Core Features PDF file.
