PrintFair - Milestone 2 Progress Report

PrintFair: A Mobile-Based Printing Request and Management System for XU Library

1. What Was Completed

We implemented the major user interfaces of PrintFair based on our Milestone 1 UI/UX designs. The application now includes navigable student and admin screens, working buttons, input forms, and a separate PC document retrieval webpage.

We also added basic interactions using sample data, including printing requests, allowance tracking, transaction history, and printing station status updates. The interface follows our blue, white, and gold design and adjusts to different screen sizes.

2. What Remains to Be Developed

The application still requires backend integration for actual PDF uploads, account authentication, document storage, and retrieval-code verification across devices.

- **Database and Firebase integration**
- **Actual PDF processing and storage**
- **Backend validation of printing allowances**
- **Further testing and Android application packaging**

3. Problems Encountered

During development, we encountered issues with request statuses, printing history, and allowance calculations. Some cancelled or failed requests were not properly retained in history. We also encountered minor layout inconsistencies and local server path errors when testing the application in a browser.

4. How the Problems Were Addressed

We revised the request-handling logic so cancelled, failed, expired, and retrieved requests remain recorded. We also adjusted the allowance calculations to distinguish pending reservations from retrieved pages.

The interface styling and navigation were refined to better match our original mockups, and the local project paths were corrected to allow browser testing.

5. Current Status

PrintFair currently has a navigable student and admin interface with working UI interactions and a supporting PC retrieval page. The application uses sample data for now, while backend functionality and actual printing operations remain outside the current implementation.
